Beginning C++ Programming
Overloading Functions

At about 2:30 in the video, the following code is incorrect:

```
void display(std::vector v);
```

The vector parameter needs to have a template parameter specifying the type of element in the vector container. For example,

```
void display(std::vector<int> v);
void display(std::vector<std::string> v);
```

and so on.

Thanks to Florian for pointing that out.
